

Certificate of conformity regarding Safety of Toys for Kraft liners (Standard EN 71-3:2013+A1 2014)

The European Standard EN 71-3:2013+A1 2014, established by the European Committee for Standardization (CEN), specifies requirements and test methods for the measurement of some chemical elements from toys or components of toys. These chemical elements can be used if the toy or components of the toy exclude any exposure due to sucking, licking, swallowing or prolonged contact with the skin when used as intended or in a foreseeable way, bearing in mind the behaviour of children.

Considering this Standard, the limits of element migration from toy materials should not exceed the below mentioned levels:

Maximum migrated elements allowed (ppm)	Aluminium	Boron	Chromium	Manganese	Cobalt	Nickel	Copper	Zinc	Arsenic
	5625	1200	37,5	1200	10,5	75	622,5	3750	3,8
	Selenium	Strontium	Cadmium	Tin	Tin (org)	Antimony	Barium	Mercury	Lead
	37,5	4500	1,3	15000	0,9	45	1500	7,5	13,5

Soluble elements are extracted from toy materials under the conditions which simulate the material remaining in contact with stomach acid for a period of time after swallowing. The concentrations of the soluble elements are determined quantitatively.

Thus, as per the information available on tests done in independent testing laboratories, our Kraft liners in all its substances (80, 90 and 130 gsm) do not exceed the maximum migration levels and complies with the European Standard EN 71-3:2013+A1 2014 for safety of toys.
